Conversational AI Index

FIT5196 Data Wrangling | A2 | Semester 2, 2026

Part B Conversation records

Group number: Group030

Complete Part B in English only when conversational AI was used. Export this part, including any added rows or continuation pages, as GroupNNN_AI_index.pdf in AI_records/. Part A may refer to these record IDs; a duplicate copy of the index in the declaration PDF is not needed.

List every complete A2-related chat export. One conversation can cover several purposes or notebook sections. Add rows as needed; three rows below are placeholders, not a limit. Delete unused rows.

Record ID	Member and tool Export filename	Purpose and affected file or section	Independent verification
AI-01	Guohou Zhang — ChatGPT AI-01.txt	Task 1: discussed EDA for dirty/missing/outlier batches; isolating one incorrect field; shopping_cart JSON parsing; current-price inference; rounding; date/season and Haversine checks; local VADER use; field-specific missing-value recovery; four seasonal delivery models; residual-based outlier removal; and audit logging. Affected: Task 1 cleaning and validation sections.	Verified against the official A2 rules and executable notebook checks. Price inference was checked on held-out reliable cart equations; seasonal delivery models were evaluated on a reproducible held-out split with very strong fit; final outputs retained Dirty 500 and Missing 500 rows, and Outlier 476 rows. Local VADER/resource checks and retained-row validation were also run.
AI-02	Xinhang Ren — ChatGPT AI-02.txt	Task 2 and Task 3: discussed field-level audit-log structure; input/output reconciliation; ID, duplicate, schema and semantic-value checks; order-total validation; compact validation reporting; combining cleaned batches for customer profiles; feature choice; z-score vs min-max scaling; nonlinear transformations; and the final recommendation-table structure.	Verified using saved input/output files and notebook checks. Audit reconciliation matched 184 records (80 dirty, 80 missing, 24 outlier_row); cleaned CSVs had the required 16-column schema and 0 duplicate order IDs. Task 3 used 1,476 retained orders and produced 471 customer profiles, with z-score, min-max and nonlinear comparisons shown before the recommendation table.

What to record as verification

Identify the check and its result, with a notebook section, test or other traceable evidence reference. Examples include checking inferred prices against unused cart equations or reviewing charge residuals and retained-row checks. Asking the same AI whether its answer is correct is not sufficient.

Chat exports

Use English for all A2-related AI conversations and submit complete English chat exports. Do not selectively shorten conversations. Readable PDF, HTML, TXT, DOCX and native JSON exports are accepted. JSON must preserve the complete relevant conversation in order. Do not submit unrelated personal conversations or rely solely on live links.

For non-conversational tools without chat exports, use Part A. Do not invent a transcript.

Submission check

Place the signed Part A PDF at the root of your submission folder. When applicable, place this Part B PDF and all complete chat exports in AI_records/ inside that same folder. Submit the folder as GroupNNN_A2_submission.zip.
