Generative AI Use Declaration

FIT5196 Data Wrangling | A2 (20%) | Semester 2, 2026

Part A Group declaration

Every group completes and signs Part A, including groups that did not use AI. Complete all responses in English. Export Part A, including any continuation pages, as GroupNNN_AI_declaration.pdf inside GroupNNN_A2_submission.zip.

Group number: Group030

Select one option:

☒ One or more members used AI for A2.
☐ No group member used AI for A2.

AI use and independent verification

If AI was used, summarise the tools, purposes and material uses. For conversations, refer to the record IDs in Part B rather than repeat the index. For tools without chat exports, state each member/tool, affected file or section, assistance received and verification performed here. Add space as needed. If no AI was used, write Not applicable.

Conversational AI use is documented in Part B as records AI-01 and AI-02. The summary below covers the additional submission-readiness work performed with OpenAI Codex.

Tool and purpose. OpenAI Codex was used for submission-readiness review against the supplied checklist, repository inspection, clean-environment execution, validation, packaging, and preparation of disclosure materials.

Material assistance. It mapped the checklist to the repository contents; inspected the source modules, notebook, outputs, audit log, dependency file and staging directory; installed the pinned dependencies in an isolated Python 3.13.12 environment; executed the command-line pipeline; executed all 70 notebook code cells from a fresh test directory with a simulated marker-provided input structure; checked CSV schemas, row counts, duplicate IDs, blank cells, audit categories and semantic equality of regenerated outputs; and assembled the final submission directory and ZIP.

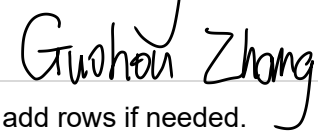

Effect on assessed work. The pre-existing analytical design, cleaning rules, model choices, Task 3 recommendations and parsed output values were not replaced. The regenerated CSVs were cell-for-cell equal to the reviewed repository outputs. Changes were limited to a freshly executed notebook, reproducibility wording, final package assembly, validation reporting and AI-disclosure materials.

Independent verification. Notebook execution: 70/70 code cells executed with 0 error outputs. Cleaned CSV rows: Dirty 500, Missing 500, Outlier 476. Cleaned CSV schema: 16 columns in the required order with 0 duplicate order IDs. Audit trail: 184 rows (80 dirty, 80 missing, 24 outlier_row). Task 3 inputs: 1,476 retained orders and 471 customer profiles. These checks were performed using the submitted code and regenerated outputs rather than by asking the AI to confirm its own work.

Member confirmation

By signing, each member confirms that their AI use is truthfully described, the applicable records are included, and the group remains responsible for its submitted work. We have described how important AI suggestions were independently checked. Each member can explain their own contribution.

Signatures

Full name	Student ID	Signature	Date
King Man Chan	36550779		21/10
Yinglin Fang	34814248		21/10
Sizhe Hong	35381949		21/10
Xinhang Ren	35134410		10.21
Guohou Zhang	35800275		21/10

All members must sign. Leave unused rows blank; add rows if needed.

Conversational AI used: include Part B as the separate AI index. Only non-conversational AI, or no AI: Part B and chat exports are not required.
